"The mission of the Institut is to provide reliable and objective statistical information on the situation of Québec as regards all aspects of Québec society for which such information is pertinent. The Institut shall be the central authority for the production and dissemination of statistical information for the government departments and bodies, except information produced for administrative purposes. The Institut shall be responsible for the carrying out of statistical surveys of general interest."

Act respecting the Institut de la statistique du Québec (S.Q. 1998, c. 44), passed by the National Assembly of Québec on 19 June 1998.

Parents' lifestyle habits as well as their physical and psychological well-being play a significant role in child development. The first part of this paper describes the prevalence of smoking and alcohol consumption among parents of Quebec infants and provides a profile of their health and mental status. Associations of these characteristics with various sociodemographic characteristics such as family type and age, educational level and income of the parents are then examined.

The second part of this publication presents previously unpublished data on the social adaptation of parents in Québec. Antisocial behaviors during childhood, adolescence and/or adulthood are examined to estimate the number of parents presenting an antisocial profile. Families with mothers or fathers who themselves had conduct problems are compared to families where parents did not have a history of antisocial symptoms on a number of risk factors in the child's environment known to compromise child development. Results from this study will be useful for intervention strategies aimed at 1) reducing the inter-generational transmission of problem behavior; 2) decreasing the risk of adverse outcomes in children of parents with a history of conduct problems; and 3) promoting healthy parenting behaviors in at-risk adolescents.
