Infection monitoring data on *Clostridium difficile* in Québec hospital centres

At the request of the Ministère de la Santé et des Services sociaux (MSSS), the monitoring system for *Clostridium difficile* infections was set up at the end of August 2004. It is operated by the Institut national de santé publique du Québec (INSPQ). The work was carried out with the help of experts from the Comité des infections nosocomiales du Québec (CINQ) and its subcommittee on provincial monitoring of nosocomial infections (*surveillance provinciale des infections nosocomiales*, SPIN).

C. difficile infection monitoring is done with the participation of 95 general and specialized hospital centres (*centres hospitaliers de soins généraux et spécialisés*, CHSGSs) in Québec. The participating hospital centres (HCs) all have more than 1,000 admissions for short-term care per year, other than in psychiatry, and neonatology.

The main objective of the monitoring system is to track trends in *Clostridium difficile* infections in the province's CHSGSs in order to adopt control measures appropriate to each HC.

This document, published on the MSSS's website (www.msss.gouv.qc.ca), is meant to inform the public on monitoring of nosocomial *C. difficile* infections, giving incidence rates by HC, by health region, and for all of Québec.

Rates are calculated according to validated data, i.e. data that have been checked for correctness. The validation procedure takes three months and involves several stages.

The data will be updated periodically.

WARNING

It is important to remember to **be cautious in interpreting incidence data** for this illness, especially in comparing institutions and regions. Several factors can affect the rates: the size of the institution, the complexity of the services offered, the type of population served, the physical layout of the facilities, the number of people hospitalized for respiratory infection, the use of antibiotics, the percentage of people above 65 in the HC, and of course the *C. difficile* strain being spread.

Moreover, *C. difficile* rates vary seasonally. An increase of infection rates in several centres over the winter months is to be expected. Also, rates can fluctuate significantly from one period to another because of a small denominator. Fluctuations due to chance level out when different periods are taken together.

For help interpreting these data, please consult the INSPQ's detailed epidemiological reports, which contain an analysis and interpretation of the data. These reports may be consulted on the INSPQ's website at www.inspq.qc.ca.

Presentation of *Clostridium difficile* data

Data on *C. difficile* only deal with nosocomial infections, i.e. infections whose symptoms began more than 72 hours after admission to an HC or less than 4 weeks after the patient's discharge. Monitoring includes all new cases of *C. difficile* infections hospitalized in the HC where the infection was contracted.

Data are presented in tabular and graph formats by region.

The **tables** present data on incidence by administrative period and for each HC in the region participating in monitoring. The incidence is calculated by dividing the number of cases observed in the HC by the average number of patient-days per administrative period for the institution (e.g. 1,000 patients staying an average of 10 days = 10,000 patient-days). This allows the level of hospital activity, which fluctuates over time and differs from HC to HC, to be taken into account. Rates are expressed as cases per 10,000 patient-days. Data are aggregated to four-week administrative periods, defined in Table 1. The size of the HCs is expressed in number of beds and in the percentage of people aged over 65.

Each regional rate is presented **graphically** and is compared to the incidence for the whole province. These are aggregated data. The regional incidences are compiled from the data from the HCs in a given region, just as the provincial rates are compiled from the data from all participating HCs.

Table 1. Administrative periods are defined as follows :
