
and the Functions of its Important
parts of the whole. The Noble
but Little—Worthy Careful
Consideration,
Editor of the Scientific American :
If you permit us to make known to the
the facts we have learned during the
8 years, concerning disorders of the
Kidneys and the various troubles of the
system so easily break down? You are
publishing a Scientific paper, and are
interested except in error of thought. It is
not necessary to add, that the "Guide"
would contain these facts, for very
few reasons.

H. H. WARNER & CO.,
Proprietors of "Warner's Safe Cure."

It was my emphasize and clearly ex-
plain the relation the kidneys sustain to the
whole system, and the various troubles of the
system so easily break down? You are
publishing a Scientific paper, and are
interested except in error of thought. It is
not necessary to add, that the "Guide"
would contain these facts, for very
few reasons.

to take one from the human wash-bowl before using for the public benefit.

I will imagine that we have before us a shaped like a bean, smooth and glisten, about four inches in length, two in and one in thickness. It ordinarily weighs the adult male, about five ounces.

an? you say. But under
the average size man

men quail, and the blood is driven through them, *thick or severe*, may be called, *many times a day*, as we see through the heart, making a constant evolution of blood, and the blood from blood they separate the waste material, always steadily, night and day, do not allow the blood to live as the heart itself, and fully as much vital importance; removing instead from 55 gallons of blood, 1000 water, 1000 sugar, 1000 oil, 1000 salt, 1000 lime, 1000 acids, or 9195 hogues a year! What a wonder that the blood should last any length of time under such a strain, treading and bogged into mire!

Since this delicate organ, open to our nostrils, and to our lips, and will roughly defend its interior.

And it is of a reddish-brown color, and smaller than; filled with a web of nerves, about the size of a spider, and the arteries, ending in a little web midway from the outside, opening the cavity of the heart, and the veins of the pelvis, or, roughly speaking, a which is for the purpose of holding the blood in the pelvis, and the arteries descend from here into the ureters, so on to the outside of the body. These tubes are the *ureters*, and right here is where *calculi* of the kidneys first begin.

Seeing the vast amount of work which has to be done, and the great irregularity in our habits, from cold, from living, from stimulants or a thousand other causes, the blood in the pelvis may become somewhat weakened in its force.

What is the result? Constriction or stoppage of the current of blood in the small vessels surrounding them, which are blocked; these delicate membranes then become inflamed, and the blood is formed, which collects in the pelvis or the tubes are at first partially, and finally totally blocked, and the blood in the pelvis set goes on distending with this pressure, pressing upon the blood vessels.

In this time, remember, the blood is in the pelvis, and is to be filtered, is

not take any other route

essity, of having the kidneys in order? You expect when they are diseased or injured, no one would expect to have pure blood and escape disease. It is but just as reasonable to expect, if a house were set across a fire, that the people inside would be compelled to go through its pestilential doors, an escape from the flames and disease, as for one to expect to have pure blood and escape disease, when through a diseased kidney.

Now, what is the result? Why, then, the pure blood is not sent to the head, the arms, the legs, along into every organ, into every tissue, tissue, flesh and bones, from the head to the feet, and the result is, a general debility, or, in other words, the body is weaker than another, a tissue train of diseases is established, a consumptive disease, a disease of the lungs, where there is a delirious stomach; weakness, inactivity, palpitations or heart disease, these are the effects of the heart must soon feel the effects of the disease, as it requires pure blood to keep its right action. It becomes a compensation for the natural stimulus wanting, in its endeavor to drive the impure blood through this obstacle, and the result is, a general loss-of-breath feeling. Unnatural as this condition of labor is, the heart must soon falter, and the result is, a general loss-of-breath feeling, and death from apparent heart disease. It is the verdict.

But the medical profession, as learned and as good as they are, and as they call the names, treat them alone, and patients for the arteries are carrying along death and disease, and the result is, a general loss-of-breath feeling, and death from apparent heart disease, which here in our wash-bowls are putrefaction, and, which should be cured at once.

But this is not all the kidneys have to do; you must remember that each adult man must send out about one hundred and twenty-four hours to supply the rest of the body which is constantly going into decay, and the kidneys have to do, too, the kidneys have to separate from

ou say, "my kidneys are
pain in the back" Mist

the state of kidney disease of so bad a nature that the organs are rotten, and they have never there had a pain nor an ache? Because the disease begins, as we have shown, in the interior of the kidneys, and the pain is not felt until the late stage of the secretion of pain. Why this is so may never know.

When you consider their great work, the function of their structure, the ease with which they are deranged, can you wonder that the ill-health of our men and women is so often long and lingering, and is reported as so vital an organ is impaired. No woman, some writers say, are degenerating. They are so near the end of their career, that of keeping this machinery is working for her? Could the finest engine do even a trifling part of the work of the kidney? Is it not a great part of the engine? Don't you see how enormous this hidden disease is? It is lurking about us constantly, without giving any warning.

Some of the most skillful physicians cannot detect it sometimes, for the kidneys themselves cannot be seen by any means. It is a hidden command. Even an analysis of the urine, chemically and microscopically, tells nothing definite. The disease is so hidden that the organs are fairly broken down, and then men look out for them, as disease, no longer when situated, to 93 per cent, as it is, after the kidneys are broken down, as it is in the breaking down of these long tubes in the interior of the kidney.

When you value your health, when you are free from sickness and suffering, give your organs some attention. Keep them in good condition, and thus prevent (as is the case with the lungs) the disease of the Urinary or Spleen's Spleen Cure, as it becomes years and years better known for its wonderful results. It is the best medicine for the kidneys, and is doing more to increase the duration of life than all the physicians have known of.

The Spleen Cure is a true specific, mild but certain, pleasant but energetic and agreeable to the taste, and when sick as a cure, and never let

bottles as a preventive,
as may be kept in proper
ure that health and long

by blessing.
